

Systems Overview — Notion Agents + Databases

This page documents the current “UK reseller expert” workspace setup: what each agent does, what databases exist, and how the systems connect — written so it’s understandable to you *and* usable as the basis for a future template/marketing description.

1) The main operating system (daily navigation)

Control hub

- **Task + Activity Dashboard:** your daily control panel for tasks + activity review. (Holds the My Tasks database, Weekly Reviews, Daily Email Summary pages, and the “Today — Command Brief” page.)

Primary task system

- **My Tasks** (database)
 - Purpose: the single place to track work across personal admin + reseller ops + digital projects.
 - Key properties:
 - **Status:** Not started / To-do / In progress / Done
 - **Due, Completed on, notes**
 - **Parent/Subtasks** (self-relation) for task breakdown
 - **Current focus** (multi-select): Passport; Auction system (refine); Digital tools review; Projects review + monetise
 - How you use it: you run the week through “current focus” areas, then keep day-to-day execution inside My Tasks.

2) Agents (what each agent does)

A) Email manager (custom agent) — *the only daily auto-run agent*

- Trigger: **scheduled daily run at 09:00 Europe/London.**
- Inbox scope: **walkerlouisha5@gmail.com only** (other accounts are forwarded/imported into this mailbox).
- Core outputs:
 - 1) Creates a 📧 **Daily Email Summary — YYYY-MM-DD** page under Task + Activity Dashboard
 - 2) Produces a grouped summary designed for fast decision-making:
 - **Do Today (Top 3)**
 - Needs Reply / Action Required
 - Finance/Subscription; Verify/Review (security)
 - Vinted + Priority Platforms (Nextdoor/Facebook/Gumtree)
 - Auto-Archived (done) + Come Back Later (labelled) + Possible Junk (needs decision)
- Credit minimization behavior:
 - **Scan first at thread level**
 - Only deep-read when needed (finance/security/replies/deadlines/actions)
 - Avoid deep-reading low-priority marketing/digests
- Retention rules:
 - Daily Email Summary pages are **archived after 7 days** (never deleted).
- "One-page brief" behavior:
 - Uses a single page, **Today — Command Brief**, as the current-day command center.
 - Before overwriting Today, the previous brief is copied to an archived page (📦 **Today Brief Archive — YYYY-MM-DD**).

B) Memtime Notion Ops Agent (custom agent) — *manual-only*

- Current trigger mode: **@mention only** (all automatic triggers disabled).
- Intended use:
 - On demand, turn the daily summary + tasks into a "command brief" (what changed, what to do first, what's due this week).
 - Also used as a "consistency" agent (checks that databases/properties are mapped consistently for operational tracking).

C) Other agents (present in workspace)

Your workspace includes additional custom agents (e.g., Weekly Review, Digital PA, Workspace auditor, content/creative agents). Some may be active historically but are currently being kept off automatic triggers to minimize credit usage.

3) Email → Notion logging system (what happens every day)

1. Email arrives (including forwarded/import-labeled sub-accounts)
2. **Email manager** runs daily
3. It produces:
 - **Daily Email Summary page** (what changed today)
 - Updates/logs to relevant operational databases when configured (e.g., auction alerts, platform activity)
4. You review "Do Today (Top 3)" and decisions, then execute via **My Tasks**
5. If you want a single prioritised brief, you @mention **Memtime** to summarise into **Today — Command Brief**

4) Reseller operations system (Lots → Invoices → Listings)

Navigation + execution hub

- **Reseller Command Center** (page)
 - Purpose: the top-level map of the reseller workflow.

The core process

- **Reseller Workflow — Quick Guide (Lots → Invoice → Listings)** (page)
- **System Overview (Lots → Invoices → Listings)** (page)
- **Step 1 START HERE!** (page)

Auction intelligence layer

-  **Auction AI System** (page)
 - Purpose: decision rules, deal scoring, and repeatable prompts for buying discipline and capital protection.

Operational trackers (databases/pages referenced in workflows)

- **Platform Activity Log** (database)
 - Purpose: capture platform signals (offers, messages, sold, favourites, payouts, etc.) as structured events.
- **Auction Alert Log** (database)
 - Purpose: store "new lot alert" emails as structured rows for review.
- **Outbid Tracker** (database)
 - Purpose: store outbid notifications with decision fields (re-bid vs walk away) and max-bid logic.

5) Digital tools + subscriptions system

- **Digital Activity Dashboard** (page)
 - Purpose: the home for tracking apps/tools you use.
- **Digital Activity Log** (database)
 - Purpose: log what you did with tools (learning, trials, workflow tests).
- **Digital Products & Subscriptions** (database)
 - Purpose: track each tool, cost, renewal, and whether it's worth keeping.
 - Includes an "intake" pattern (e.g., "New info or updates" page) to capture messy notes that later become clean records.

6) Content / creator system (Veil Cartography)

-  **Social Media Dashboard** (page)
 - Purpose: command centre for content production (projects, publishing calendar, brand docs).
 - Supporting "system pages":
 - Weekly Review pages
 - Documents/library pages
-

7) What makes this setup marketable (the value proposition)

- **Single inbox → daily operations brief:** email becomes a structured daily command feed, not a pile.
- **One tasks database:** everything lands in one execution system with weekly focus tags.
- **Ops + intelligence split:** operational trackers (logs) feed decision frameworks (Auction AI System).
- **Low-maintenance history:** daily summaries are kept for audit but auto-archived to avoid clutter.
- **Cost control:** only one agent runs automatically; other agents are manual on-demand.

8) Packaging ideas (if you decide to sell this)

- Product 1: "AI Email Manager + Today Brief" template (email → daily command brief + 7-day archive)
- Product 2: "Reseller HQ: Lots → Invoices → Listings + Auction AI System" template
- Product 3: "Digital Tools Review Dashboard" (tools, renewals, comparisons, keep/cancel decisions)
